## IN THE CLAIMS:

Claims 1-47 (canceled)

- 48. (currently amended). An artificial firelog material, comprising:
- a plurality of waxed corrugated cardboard segments; (a)
- wherein a majority of said segments have faces that are compressed (b) circumferentially in relation to a central longitudinal axis of the firelog; and
- wherein a majority of said segments have surfaces faces that are (c) positioned radially outward in relation to the central longitudinal axis of the firelog.
- 49. (previously presented): An artificial firelog material as recited in claim 48: wherein said segments open or expand with heat when burned; and wherein corrugations in said segments channel oxygen throughout the segments.
- 50. (currently amended): An artificial firelog material as recited in claim 48, wherein said segments are adhered together in a generally interlocking planar an overlapping configuration.
  - 51. (currently amended): An artificial firelog material, comprising:
  - (a) a plurality of waxed corrugated cardboard segments;
- wherein a majority of said segments have faces that are compressed (b) circumferentially in relation to a central longitudinal axis of the firelog;
- wherein a majority of said segments have surfaces faces that are (c) positioned radially outward in relation to the central longitudinal axis of the firelog; and
- wherein said segments are adhered together in a generally interlocking planar an overlapping configuration.
  - 52. (previously presented): An artificial firelog material as recited in claim 51: wherein said segments open or expand with heat when burned; and

wherein corrugations in said segments channel oxygen throughout the segments.

- 53. (currently amended). An artificial firelog material, comprising:
- a plurality of waxed corrugated cardboard segments; (a)
- wherein a majority of said segments have faces that are compressed (b) circumferentially in relation to a central longitudinal axis of the firelog;
- wherein a majority of said segments have surfaces faces that are (c) positioned radially outward in relation to the central longitudinal axis of the firelog;
- wherein said segments are adhered together in a generally interlocking planar an overlapping configuration.
  - wherein said segments open or expand with heat when burned; and (e)
- wherein corrugations in said segments channel oxygen throughout the (f) segments.

Claims 54-59 (canceled)
